

Eco Signs invests in a new Tekcel router

As part of a major expansion plan involving a move to new purpose built premises in Swindon, south-west sign company, Eco Signs, has recently invested in a new 3m x 2m CNC router from Tekcel CNC Solutions.

As one of the country's leading suppliers of signage solutions, Eco Signs has earned a reputation for outstanding service, design and innovation. The company is committed to providing its wide range of clients with a comprehensive package of sign services from initial planning through to design, fabrication and installation nationwide.

To facilitate this 'all encompassing' approach to the business of signs, Eco Signs has invested in the very latest printing and cutting technology, including three large format, flat bed printers which are complemented by the recent addition of the Tekcel E Series router, for its new 18000 sq ft premises in Swindon.

From foamex to stainless steel, the Tekcel E Series router now provides Eco Signs with the facility to cut every type of signmaking sheet material in-house. The E Series features an innovative auto tool change system that allows the router to switch between up to 18 cutters and ACM folding tools automatically.

Multi tool jobs such as folded sign trays in aluminium or Dibond are now a simple, 'one touch' operation for the router operators at Eco Signs. The Tekcel router at Eco Signs is also fitted with a material registration system that has proved to be invaluable, especially when cutting rigid sheet output from the company's three flatbed inkjet printers.

According to Mark Pitt at Eco Signs, "... the new Tekcel router is now a key component in our state of the art, signmaking facilities here at Eco Signs, directly contributing to the high standard of products and services we're committed to offering our customers throughout the UK."
